

TAPXORA LIMS APP

Online Laboratory Information Management System for Nigerian diagnostic laboratories

- Website: lims.tapxora.com
- Built for patient registration, sample tracking, results, reporting, billing, inventory, accounting, and online operations.
- Contact: 07067038882

Executive Snapshot

- Tapxora LIMS is a web-based operating system for small and mid-sized laboratories.
- The app is designed around Nigerian field realities: paper-heavy workflows, fragmented billing, weak traceability, and limited operational reporting.
- It brings clinical workflow and business workflow into one system: samples, results, reports, inventory, payments, expenses, and revenue analysis.
- Current investor-sensitive data to insert: live customer count, monthly revenue, pipeline value, deployment cost, and churn.

Positioning: practical lab infrastructure for markets where connectivity cannot be assumed.

Problem

- Manual and disconnected workflows interrupt patient registration, result entry, reporting, billing, and end-of-day reconciliation.
- Many labs still depend on notebooks, spreadsheets, paper receipts, manual result templates, and disconnected inventory records.
- Sample traceability is weak when sample IDs, patient IDs, collection status, and result status are not tied into one workflow.
- Financial visibility is often delayed: owners may not know daily revenue, unpaid invoices, test-by-test income, expenses, and inventory-driven costs in one place.
- Manual workflows increase rework, misplaced results, delayed verification, billing leakage, and inconsistent patient experience.

Solution

- A secure, browser-based LIMS built with Next.js, Supabase, and role-based workflows.
- Supports the lab journey from patient registration to sample collection, result entry, verification, reporting, billing, accounting, and inventory.
- Direct online updates keep staff working from one central database without sync conflicts.
- Professional PDF reports and thermal-printer receipt support help labs look more credible while improving internal controls.
- Role-based access supports Admin, Receptionist, Lab Scientist, HOD of Lab / Chief Scientist, and Accountant workflows.

Analytics

Key Features

- Patient directory with search, age display, patient history, and admin edit/delete controls.
- Test catalogue with category-based selection for Haematology, Blood Group Serology, Microbiology, Chemical Pathology, and Histopathology.
- Sample IDs use a date-coded 7-digit format, making collection dates traceable from the sample code.
- Results entry supports numeric, text, dropdown, and positive/negative test types.
- Verification and reporting are separated so technicians enter results and the HOD of Lab / Chief Scientist approves them.

Sample Tracking And Reports

- Workflow: Registered -> Collected -> In Progress -> Results Entered -> Verified -> Reported.
- Each sample carries a barcode/QR-ready sample ID and custody events for chain-of-custody visibility.
- Results are grouped by date and Sample ID for traceability, printing, and download.
- Out-of-range numeric results are shown clinically with H for high and L for low, using red for visibility.
- A patient with multiple tests can receive a consolidated report grouped by sample rather than scattered paper sheets.

Online-First Advantage

- Every authorized staff member sees the same central Supabase data without local sync conflicts.
- Direct database writes make patient registration, sample movement, billing, and reports reflect quickly across modules.
- Server-side RLS and RPC functions keep sensitive clinical and financial operations controlled.
- Netlify deployment reduces installation friction and keeps updates easy to roll out.
- This architecture prioritizes speed, predictable behavior, and simpler public hosting.

Accounting & Financial Reports

- Automatic invoices are created from selected tests and catalogue prices.
- Payment status supports Paid, Partial, and Unpaid tracking.
- Thermal receipt printing supports everyday front-desk payment operations.
- Account dashboard shows money received, tests billed, totals, and test category income analysis.
- Expense and inventory-cost tracking help owners understand monthly costs and operational margins.

Market Opportunity In Nigeria

- Primary customers: private diagnostic laboratories, hospital labs, clinic labs, specialist labs, and growing lab chains.
- Buyer profiles: lab owners, medical directors, operations managers, and finance/admin leads.
- Adoption pressure: professional reporting, auditability, revenue control, faster turnaround time, and operational visibility.
- Market size to insert: number of target labs in Nigeria: _____.
- Pricing benchmark to insert: current monthly spend on software, paper, admin labor, and lost billing leakage: _____.

Analytics

No fabricated TAM/SAM/SOM included. Add verified market data before investor distribution.

Business Model

- Subscription SaaS by facility or branch.
- Tiered plans based on lab size, number of users, number of monthly tests, and advanced finance/reporting needs.
- Implementation and onboarding fee for setup, staff training, data migration, and report customization.
- Optional add-ons: WhatsApp/SMS delivery, custom report templates, multi-branch analytics, and advanced accounting exports.
- Potential enterprise plan for lab chains, hospitals, and multi-location diagnostic groups.

Competitive Advantage

- Simple online workflow is central, not an afterthought.
- Designed around Nigerian laboratory and owner needs, including billing, receipts, expenses, and inventory.
- Traceable samples, verification, audit logs, and grouped reports improve clinical quality control.
- Role-based access helps owners separate receptionist, scientist, HOD/chief scientist, accountant, and admin responsibilities.
- Modern web deployment reduces installation friction while keeping the system easy to maintain.

Traction / Roadmap

- Current product: authentication, role management, patients, test catalogue, sample tracking, result entry, verification, reporting, billing, inventory, accounting, dashboards, and audit logs.
- Current traction to insert: pilots, active labs, monthly active users, tests processed, revenue, or signed LOIs: _____.
- Next milestones: user acceptance testing, live deployment hardening, training materials, SMS/ WhatsApp delivery, multi-branch administration, and deeper financial exports.
- Roadmap metric to insert: target number of pilot laboratories in next 3 to 6 months: _____.
- Roadmap metric to insert: target paid deployments in next 12 months: _____.

Implementation, Security & Compliance

- Supabase authentication and PostgreSQL Row Level Security protect facility data boundaries.
- Role-based UI and route protection reduce accidental exposure of sensitive workflows.
- Audit logs record important actions across clinical and admin workflows.
- NDPR consent capture is included in patient registration.
- Security items to confirm before enterprise sale: penetration test, backup policy, incident response plan, support SLA, and formal NDPR review.

Ask / Call To Action

- Funding ask: NGN _____ or USD _____.
- Use of funds: product hardening, customer onboarding, sales, support, compliance, cloud infrastructure, and training materials.
- Target milestones after funding: _____ paying labs, _____ monthly tests processed, _____ monthly recurring revenue.
- Investor role: capital, healthcare distribution relationships, enterprise sales support, and governance.
